

Use Case Model

Direct primary interactions

Between the user and 'Search Share Price History' use case, the User initiates this to retrieve daily price information for a specific company symbol.

For the 'Compare Company Performance', the user triggers this to view and compare the share performance of two different companies side-by-side on a single chart.

The 'View Advanced Analytics' use case allows the User chooses to view complex mathematical calculations, such as volatility and moving averages, to enhance their technical analysis.

Indirect and Included Interactions

The 'Filter by Date Range' is automatically included when a User searches or compares shares, ensuring the system enforces the mandatory 2-year maximum range constraint.

For the 'View Graphical Analysis' use case, it is included by the search and comparison use cases to render the retrieved data into the required line chart format for the User.

The 'Manage Offline Data' use case is included to ensure that whenever the user retrieves data, it is persistently stored (JSON/SQL) for later use in the absence of a network connection.

For the 'View Advanced Analytics' use case, it is shown as an extension of 'Graphical Analysis', meaning that the User can optionally choose to "add" these analytics to their standard chart view.
